## 2. About This Release

***All applications compiled with Beta Release from version 1.15.X.X must be compiled with Public Release version 1.17.0.0 or higher when it is available.***

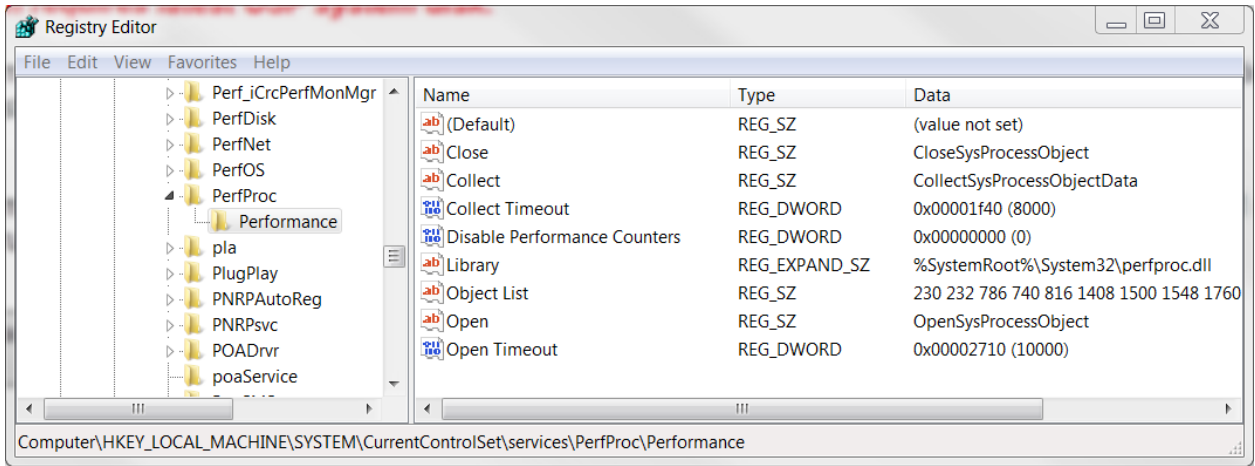

***In current version of THINC-API, some of the existing functions related to ATC, Tool, TailStock, and Chuck Data from DATA-API or Command API might not function correctly on OSP-P300S (SLP) and OSP-P300L control.***

***Please refer to the help file for detail usage and compatibility information of each function.***  
***This version requires latest OSP system disk***

From this release and forward, THINC API libraries will check dependency libraries during installation. THINC API will fail to install if version of dependency OCJ libraries cannot support current version of THINC API.

From this release and forward, API Notifier will delay the checking of API for an approximately of 1 minutes or so after NC is running. API Notifier service does use Windows Performance Counters service. As a result, API Notifier will not run correctly if Windows Performance Counters service is not enable. During the installation of THINC-API, Windows Performance Counters will be reset to 0 in the Windows system registry as shown below:

## 4. Known Bugs and Limitations

This section identifies known problems in this release and describes any work-arounds.

### 4.1 Defect

#### 4.1.1 General Defect

DATA-API library, Okuma.CLDATAPI.dll, cannot create directly under ASP.NET web application.

Solution/Work-arounds: Create and initialize DATA-API in a separate thread. All function calls must be called from objects created inside separated thread mentioned above.

DATA-API library can only support applications designed with single-threaded apartment of COM threading model. The underlying library, LDATAPI.dll, cannot be loaded during call to CMachine.Init function when an MTAThread attribute is applied to the application.

Solution/Work-arounds: None

#### 4.1.2 Firebird Database Log File

THINC-API libraries compiled with .NET Framework 1.1 use Firebird Database engine. The log file created by Firebird database engine can be corrupted, unexpectedly.

Solution/Work-arounds: A bat file is created during the installation of THINC-API and will be executed every time Windows is first started to replace the existing log.fdb located in "D:\Program files\Okuma\LoggingService" to prevent file corruption.

*New THINC-API libraries that compiled with .NET Framework 4.0 will use SQLite database for its logging service. All applications should use new version THINC-API if possible to prevent using Firebird database and to be compatible with Windows 10.*

#### 4.1.3 Data-API

##### 4.1.3.1 MacMan.COperationHistory class

Function:

```

Int32 COperation* GetOperationHistory(Int32 intIndex) ;
ArrayList* GetOperationHistory(Int32 intFromIndex, Int32 intToIndex);
Int32 GetMaxCount() ;
Int32 GetCount() ;

```

Symptom: Failed to get correct data for Subsystem L and R side if MacMan screen is different than current setting of subsystem. It always gets the data from current MacMan screen.

THINC-API	Version: S5015-008-29
Release Notes For Lathe	Date: 02/26/2019

Solution/Work around: None

#### 4.1.3.2 CAxis class

Function:

```
Double GetActualPositionProgramCoord( AxisIndex1Enum enAxisIndex);
Double GetTargetPosition (AxisIndex1Enum enAxisIndex);
```

Symptom: The Z-axis position for sub system NC-AL and NC-AR does not return data correctly. It is based on the current selection of spindle in NC panel or command program G140/G141.

Solution/Work around: None

## 4.2 Defects Fixed in this Release

### 4.2.1 DATA-API

Symptom: All functions that can support data unit in metric or inch will not add decimal value correctly when the decimal value is 0.0001 or 0.00001 inches.

#### 4.2.1.1 CATC class

Symptom: Cannot support ATC having more than 200 pots.

The following functions are fixed to support ATC magazine having more than 200 pots or Extended ATC magazine spec PLC3(72,7) ON:

```
Public Function GetToolNo(intPotNo As Integer) As Integer
Public Function GetToolKind (intPotNo As Integer) As ToolKindEnum
Public Function IsReservedPot (intPotNo As Integer) As Boolean
Public Function GetNextTool As ToolProperty
Public Function GetToolInStation (enTurretStation As TurretStationEnum) As ToolProperty
Public Function GetToolSize (intPotNo As Integer) As ToolSizeEnum
```

#### 4.2.1.2 CTool class

```
Public Sub SetToolNumberInGroup3 (
    intGroupNo As Integer,
    intToolNo As Integer,
    enEdgeNo As ToolEdgeEnum
)
```

Symptom: The function will not set the select group correctly when multi-edges tool spec is 12 or 4.
